TITLE: ~~Gyrolite From the Effusive Traps of the Middle Course of the~~
Nizhnyaya Tunguska River (Gyrolit iz effuzivnykh trappov srednego
techeniya r. Nizhney Tunguski)

PERIODICAL: Doklady Akademii nauk SSSR, 1958, Vol 123, Nr 3, pp 538-541
(USSR)

ABSTRACT: The author recalls the various discoveries of gyrolite and reviews its description in the literature (Refs 4-6). Gyrolite $[Ca_4(OH)_2Si_6O_{15} \cdot 3H_2O]$ has not been found previously in the USSR although in an unpublished manuscript A. V. Skropyshev mentions the gyrolite of the middle course of the Nizhnyaya Tunguska River. The author found gyrolite on the left side of the Pravaya ~~Khovorkili River valley (right hand Nizhnyaya Tunguska~~ tributary). It occurs in the upper amygdaloidal zone of a normal lava flow. The amygdaloidal rock is described; veinlets of gyrolite are shown in figure 1. The constants of gyrolite are described and compared with data from the literature (Refs 3, 4, 6-8). P. N. Nissenbaum made the chemical analysis (Table 1), which agrees well with other analyses (Table 2) especially that

Card 1/3

Gyrolite From the Effusive Traps of the Middle
Course of the ^{Nizhnyaya} Tunguska River

SOV/20-123-3-45/54

of reference 4. The spectrum analysis reveals, in addition to the elements chemically determined, the presence of manganese (approximately 0.005) and strontium (approximately 0.05). Figure 2 shows the differential thermal analysis curve of the gyrolite. The water loss (14.1%) through heating up to 740-780° is somewhat greater than the total amount of water in the mineral as determined by chemical analysis. This might be due to the hygroscopic moisture (some 3.5%). The sharp maximum on the curve at 870° (Fig 2) corresponds to the transformation of the gyrolite into pseudo wollastonite. At 1000° the gyrolite is completely transformed to α -wollastonite. Gyrolite forms hydrothermally as the trap magma cools. It has probably originated by metasomatism of hot silica solutions with calcium-rich diabases. It can also be synthesized between 150 and 400° at an absolute pressure between 5 and 163 atmospheres.

AUTHOR: Kudryashova, V.I.

TITLE: Hydrothermal Mineralization in Connection with the Traps of the Middle Part of the Nizhnyaya Tunguska River

PERIODICAL: Izvestiya Akademii nauk SSSR, Seriya geologicheskaya, 1959, Nr 9, pp 31-39 (USSR)

ABSTRACT: Describing the traps of the middle part of the Nizhnyaya Tunguska river, the author finds that the common geochemical character of all hydrothermal formations of the region are conditioned by the single trap magma and the multiplicity of minerals is caused only by physico-chemical conditions of their formation. In general, all phenomena of hydrothermal mineralization are connected with intrusive and effusive traps. The author distinguishes two lines of development of the mineralization, the post-intrusive and the post-lava mineralization. The post-intrusive hydrothermal

Card 1/5

SOV/11-59-9-4/18

Hydrothermal Mineralization in Connection with the Traps of the
Middle Part of the Nizhnyaya Tunguska River

mineralization regularly and gradually evolves from high to middle and low temperature formations and has a genetic association with the trap intrusions of the region. These intrusions represent four morphologic types associated with definite stratigraphic suites of the tuffogenous series. The author further gives a table indicating a genetic series of hydrothermal formations associated with the intrusive magma. The high temperature stage of mineralization is associated with the pyroxene-magnetite-apatite-zeolite formation. Spectral analyses show the presence of Mn, Ga, Cu, Ti, V, Co, Ni, Cr, Sr in all minerals, the presence of Zr, Be, Sc, Mo, Pb (in minute doses) in pyroxene and magnetite, and the presence of rare earths La, Ce, Nd - in apatite. The middle temperature stage is associated with the quartz-barite-sulfide-calcite formations. Hydrothermal

Card 2/5

SOV/11-59-9-4/18

Hydrothermal Mineralization in Connection with the Traps of the
Middle Part of the Nishnyaya Tunguska River

solutions of this stage are, presumably, of acid composition and contained Ba, Sr, Si, Fe, Cu, Pb, Zn, Ag as well as the anions S^{2-} , SO_3^{2-} , CO_3^{2-} , and H_2O . When penetrating into the tuffogenous rocks these hydrosulfides, enriched by heavy elements mixed with the oxygen from the air and ground waters, formed sulfates (barite) and sulfides. The low temperature stage represents the paleo-fumarole and paleo-solfatara ("mofetta") types of mineralization. The paleo-fumarole stage is associated with the garnet-vesuvianite and garnet-pyroxene formations. The spectral analysis shows the presence of Mn, Ti, V, Zn, Co, Ni, Zr, Cr, Sr, Ba. The paleo-solfatara type of mineralization is associated with the zeolite-calcite formations, the adjacent tuffogenous rocks also being submitted to the intrusive zeolitization and carbonatization.

Card 3/5

SOV/11-59-9-4/18

Hydrothermal Mineralization in Connection with the Traps of the
Middle Part of the Nizhnyaya Tunguska River

Spectral analyses show the presence of Ca, Fe, Cu, CO₂, H₂S, H₂O, and also of Sr, Ba, Ti. The post-lava trap intrusions influenced and metamorphized the enclosing rocks and lavas. In certain places lavas were entirely transformed into albite-amphibolitic rocks with admixture of sphene and apatite. The texture of these rocks became almond-like, "almonds" being filled with phenocrysts, apatite, diopside, magnetite, chalcopyrite, and zeolite. Minerals found in these metamorphized rocks were the same as those in the trap formations, only some reconstruction of chemical compounds occurred under the influence of the high temperature and of volatile components such as F, Cl, CO₂, H₂O, and H₂S. Hydrothermal solutions in the lavas were to a certain degree monotonous. They contained Ca, Na, Al, Si, Fe, that is the main petrogenous elements of enclosing rocks and

Dressing of quartz sands for high quality glass. H. A. LAMM, V. N. KUDRYASHOVA, AND A. V. USMANOVA. *Legkaya Prom.*, 11 171-21-31 (1951).--The iron oxide content of 0.024% in unwashed sand and 0.028% in washed sand was reduced, respectively, by 37.5% and 51.8%, using a magnetic separator having a capacity of 0.5 to 1.0 tons/hr. The flotation of three varieties of sand having an iron oxide content of 0.014 to 0.040, 0.040 to 0.070, and 0.065% resulted in the removal of 30.0 to 50.0, 50.0 to 67.0, and 66.0% iron oxides, respectively. A magnetic separator is suitable for quartz sands. The flotation should be used chiefly for sands containing 0.04% and over iron oxides; sands having 0.02 to 0.03% iron oxides should be treated on a separator.

TITLE: Method of determining the nature of the electric conductivity of potassium glasses.

SOURCE: Zhurnal prikladnoy khimii, v.37, no.1, 1964, 202-204

TOPIC TAGS: potassium glass, electrical conductivity, potassium ion, borosilicate glass

ABSTRACT: In the apparatus shown in the figure a series of runs were made at different current densities to determine the ratio of the electric charges to the mass of the charge carrier, and the current yield, in order to verify the ionic nature of electrical conductance in potassium glasses. In all cases the amount of potassium formed corresponded to the amount of electricity passed. This electricity was consumed in the ionic transfer of potassium from the potassium nitrate melt through the glass in a vacuum with its subsequent neutralization. A borosilicate glass containing 20 mol.% K_2O was investigated and its conductivity was found to be caused only by the posi-

AUTHOR: Kudryatsev, V. B. (Moscow)

TITLE: Completeness theorem for a class of automata without feedbacks

SOURCE: Problemy kibernetiki. no. 8. Moscow, 91-115

TEXT: The completeness problem for automata which realize logical functions with time delays is considered in two different senses. The construction of the more complex automata from the original ones is governed by certain conditions. The completeness criteria are formulated in terms of pre-complete sets; thereby for completeness in the first sense there are only 6 pre-complete sets, whereas for completeness in the second sense they form already a denumerable set. Suppose R is a fixed set and \mathcal{M} any of its subsets. \mathcal{M} is said to be a pre-complete set if it is not complete, but for each element $\varphi \in R \setminus \mathcal{M}$ the set $\mathcal{M} \cup \{\varphi\}$ is complete. The set of automata $\{[f_i, t_i]\}_i$ is said to be complete in the first sense if for any

Completeness theorem for ...

function $f(x_1, \dots, x_n)$ of P_2 and for any $t = 0, 1, 2, \dots$ it is possible to construct by (given) rules an automaton $[f(x_1, \dots, x_n), t]$ from the automata of the system $\{[f_i, t_i]\}_i$; completeness in the second sense is defined analogously, but instead of "for any t " it reads "for at least one integer $t(f) \geq 0$ ". Theorem 3: The set of automata $\{[f_i, t_i]\}_i$ is complete in the first sense if and only if it contains: a) some subset of automata $\{[f_{i_k}, 0]\}_k$, where $\{f_{i_k}\}_k$ is a system which is complete in P_2 ; b) the automaton $[f, 1]$, where f is not a constant. Corollary: Each system of automata which is complete in the first sense contains more than one automaton. Analogous results are obtained for completeness in the second sense. In terms of the concept of pre-complete sets, the main result of the paper is formulated as the following theorem: The set of pairs $\{(f_i, t_i)\}_i$ is complete with respect to (the set) $\{l\}$ if and only if

it is not entirely contained in any of the denumerable sets \tilde{L} , \tilde{S} , \tilde{M} etc. which are closed under the operation of superposition. The sets \tilde{L} , \tilde{S} , \tilde{M} , etc. are defined in the paper.) Hence follows that each of these sets is pre-complete with respect to \mathcal{U} and that there are no other such pre-complete sets in \tilde{P}_2 . (\tilde{P}_2 denotes the set of pairs (f, t) , where $f \in P_2$ and $t = 0, 1, 2, \dots$.) The last section of the paper deals with finite automata which transform a sequence of input letter $x(t)$ into a sequence of output letters $z(t)$. There are 8 figures.

Kudryavits, K. I., Morskoe gidrologicheskoe prognozy. [Marine hydrological forecasts.]
Leningrad, Gidromet. Izdat., 1951. 275 p. 135 figs., 64 tables, 112 refs. DLC--A new
technical work intended as a text for university students of oceanography, hydrology and
hydrography, with special emphasis on forecasting sea ice, temperatures, levels, state of sea
and currents in the open ocean, gulfs and bays. The basis of the methods treated are synoptic
and objective tools (analogs, regression curves, anomaly charts and historical or climatological
data), and the types of forecasting include short, medium, seasonal and long range forecasting.
The basic theory is developed in each chapter, followed by quantitative application and
examples. The chapters on ice, wave and current forecasting include material on methods of
observation and give critical evaluation of dependability of methods studied. *Subject Headings:*

TITLE: Application of T. P. Maryutin's Method to Forecasting
Nonperiodic Level Fluctuations in Some Baltic Sea
Bays (Opyt primeneniya metoda T. P. Maryutina k
prognozu neperiodicheskikh kolebaniy urovnya v neko-
torykh zalivakh Baltiyskogo morya)

PERIODICAL: Tr. Leningr. gidrometeorol. in-ta, 1956, Nr 5-6,
pp 160-166

ABSTRACT: The authors determine the applicability of T. P.
Maryutin's method (Tr. NIU, GUGMS, 1941, Ser 5, Nr 1)
to forecast fluctuations in the level of the Gulfs of
Finland and of Riga. These fluctuations are caused
by the water being driven offshore and onshore.
Observations made between 1933 and 1935 by the posts

Card 1/2

Application of T. P. Maryutin's Method (Cont.)

situated at the head of the Gulf of Finland, and between 1948 and 1952 at the Aynazhi, Kolka, and Libava stations were analyzed. In the Gulf of Finland two curves of level-variation were distinguished and three in the Gulf of Riga. Eight inertional equations were derived for forecasting the level in the Gulf of Finland six or eight hours in advance, and two for forecasting the level in the Gulf of Riga 12 hours in advance. The close correspondence between calculated levels and the observed ones convinced the authors that Maryutin's method is applicable to forecasting nonperiodic fluctuations in the levels of these gulfs.

THE PHYSIOLOGICAL PHENOMENA IN THE EXTENSION REACTION AND THE TONIC CONTRACTION REACTION OF THE SMOOTH MUSCLES OF INVERTEBRATES (*Helix pomatia* L.) UNDER THE INFLUENCE OF KCN, CO AND H₂S. N. A. KUDRYAVINA. *J. Physiol.* (U. S. S. R.) 20, 435-7 (1930); *Chem. Zentr.* 1930, II, 4275.—KCN, CO and H₂S altered the normal course of the extension and contraction reaction of the smooth musculature of the snail because they are poisons for aerobic oxidations. CO and KCN were also injurious to anaerobic processes in the snail, depressing the reactivity to elec. stimulation. It is concluded that a relation must exist between the tonic and contractile processes on the one hand and the oxidative processes on the other.

Title : The course of sleep under the action of barbamy, nembutal, and luminal under high temperature conditions

Periodical : Farm. i toks., 17, 12-18, Nov/Dec 1954

Abstract : Tested the effects of barbamy, nembutal, and luminal as soporifics on rabbits that were first treated with dinitrophenol to produce artificial fever. The induced sleep was uneven as indicated by electrocardiographs and electroencephalographs. Some of the animals died. Eight references; all USSR; six since 1940. Table; graphs.

Course of barbamil narcosis. N. A. Kudryavina
Farmakol. i Toksikol. 17, No. 2, 23-26 (1964).—In mice, rats,
guinea pigs, and dogs, but not in rabbits, the first stage of
barbamil narcosis was stimulation of motor reactions.
With repeated doses the effect wears off faster.
(in mg./kg.) inducing prolonged narcosis: mice, 100;
rabbits and dogs, 80; rats and guinea pigs, 50-80, but dura-
tion varies even with the same dose in the same animal.
Test animals sometimes die from single or repeated narcotic
doses. Julian F. Smith

 TITLE : The Pharmacology of Vitamin P.

ORIG. PUB. : Farmakol. i Toksikologiya, 1956, Vol.19, No.6, 39-43

ABSTRACT

: In mice it has been shown that the LD₅₀ of a preparation of vitamin P isolated from the dust of tea leaves is 1350 mg/kg. In cats and rabbits under anesthesia, the intravenous injection of P in doses of 10-300 mg/kg exerted a slight hypotensive influence which was not reversed by atropine but was by benzoline. Upon administration of P to decapitated animals, no hypotensive effect was produced. It was shown that P does not exert a protective effect against anaphylactic shock in guinea pigs, does not influence the threshold of sensitivity in rats, does not alter the EKG in rabbits, does not influence the absorption of

TITLE: Synthesis of linear polytriethylsiloxyalumino- and polytriethylsiloxytitanodimethylsiloxanes

PERIODICAL: Vysokomolekulyarnyye soyedineniya, v. 4, no. 3, 1962, 440-447

TEXT: Polymers were prepared by reacting α,ω -polydimethylsiloxanediols with triethylsiloxydibutoxyaluminum (TA) and bis-(triethylsiloxy)dibutoxytitanium (BI), respectively, resulting in the splitting off of butyl alcohol and the formation of metal-siloxane bonds. The starting monomers were prepared by reacting triethylsilanol with aluminum butylate and tetrabutyltitanium, respectively; the first reaction yields product

B124/B101

Synthesis of linear ...

B. This scheme is verified by the fact that no condensation of triethylsilanol yielding hexaethylidisiloxane was observed to take place which is explained to be due to its combination resulting in an intermediary donor-acceptor complex. The preparation of a polymer by reacting TA with tetramethyldisiloxanediol-1,3 (polymer I) was found to take place according to formula

(c).

The respective material had a molecular weight of about 2000, was easily soluble in benzene, and exhibited cold-flow properties. Polymer II has been prepared by heterofunctional condensation of dimethyldiacetosiloxane

Card 2/5

S/190/62/004/003/019/023
B124/E101

Synthesis of linear ...

with TA in the absence of a catalyst; its composition is

the Al atoms of one and the O atoms of another molecule as well as of intermolecular interactions has been verified by the examination of the infrared spectra of polymer I, to which the structure

(D) has been attributed. With α,ω -dioxymethylsiloxane oligomers having molecular weights of 1500, 2400, and 30,000, elastomers were prepared with rigidity increasing with the decreasing molecular weight of the reacted oligomer. The fact that

Card 3/5

Synthesis of linear ...

S/190/62/004/003/019/023
B124/B101

equimolar amounts of TA are insufficient to yield polymers of rigidity equal to those prepared with excessive TA is ascribed to hydrolytic splitting off of butoxy groups. Conclusions on the existence of intermolecular interactions are verified by the thermomechanical curves of all polymers synthesized from oligomers with molecular weights of 1500 and 2400.

Aluminodimethylsiloxanes prepared from polydimethylsiloxanediols of a molecular weight of 30,000 are elastomers which can be vulcanized to rubbers with properties resembling those of polydimethylsiloxane rubber with a molecular weight of about 500,000. There are 2 figures, 1 table, and 17 references: 12 Soviet and 5 non-Soviet. The two most recent references to English-language publications read as follows: J. D. Danforth, J. Amer. Chem. Soc. 80, 2585, 1958; D. Bradley, J. M. Tomas, Chem. and Industr., 1958, 17.

TITLE: Polarized Relay Circuit Diagrams for Operation in Communication Channels (Skhemy vklyucheniya polyarizovannogo rele dlya raboty v kanalakh svyazi)

PERIODICAL: Byulleten' izobreteniy, 1958, Nr 6, p 35 (USSR)

ABSTRACT: Class 21a¹, 20₀₉. Nr 113637 (572443 of 18 Apr 1957)
Submitted to the Committee for Inventions and Discoveries at the Ministers Council of USSR. Circuit diagrams for communication channels with single-pole keyed "ST-35" telegraph jets; including two linear windings switched in through germanium diodes and resistances, one operating with the plus pole of the incoming current, the other with the minus pole; with the dependance of the receiving relay on the nature and condition of the line diminished by the use of an accelerating winding switched in in series with the capacitor into the bridge lattice formed by the linear windings, germanium diodes and resistances.

"Zavod Lab" Vol XVI, No 9, pp 1091-1093

Uses 2 pairs of condensers -- one before one after emulsion bath -- in 2
oscillator circuits. Coated film passing between 2d pair of condensers changes
their capacitance, disrupting circuit. Voltage change is measured by inductively
coupled voltmeter, and relation established between currents and emulsion-layer
thickness.

TITLE: Method of improving the antiwear and anticorrosion properties of heavy liquid fuels. Class 23, No. 189110 [announced by All-Union Heat Engineering Institute im. F. E. Dzerzhinskiy (Vsesoyuznyy teplotekhnicheskiy institut)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 23, 1966, 62

TOPIC TAGS: fuel additive, antiwear additive, anticorrosion additive

ABSTRACT:

An Author Certificate has been issued for a method of improving the antiwear and anticorrosion properties of heavy liquid fuels [unspecified], involving the introduction of additives based on compounds, soluble in water or organic media, of the type $MeX_1 + AlX_2$, where Me is Ca, Mg, or Zn, and X_1 and X_2 are anions or functional groups, taken in quantities such that the Al/Me ratio be 0.05 to 0.95.
